1. Project Overview

MindCare is a comprehensive counselling and wellness platform consisting of two core products connected through a shared cloud backend:

Android App (User-Facing): A mobile application where end users can register, take self-assessments, browse counsellor profiles, view workshops/events, and access theory sessions. Designed with a premium, minimalist UI inspired by apps like CRED and Flow.

Admin Web App (Control Panel): A full-featured web dashboard where administrators manage everything — users, counsellors, workshops, theory sessions, questionnaire builder, bulk registration, and analytics. Everything admins create or update here is instantly reflected in the Android app.

Cloud Backend: A scalable API server and database hosted on AWS/GCP, supporting 10,000+ simultaneous users from day one with auto-scaling for future growth.

> *The admin dashboard is the control center. Every action taken in the admin panel directly controls what users see and interact with on the mobile app.*

2. System Architecture

The platform follows a client-server architecture where both the Android app and the admin web panel communicate with the same backend API. This ensures data consistency — when an admin creates a questionnaire, it immediately becomes available to app users.

How It All Connects

Component	Role	Communicates With
Android App	User-facing mobile application	Backend API (REST)
Admin Web Panel	Admin control dashboard	Backend API (REST)
Backend API	Business logic, authentication, data processing	Database, Cache, Storage
Cloud Database	PostgreSQL — stores all platform data	Backend API
Redis Cache	Session management, frequently accessed data	Backend API
Cloud Storage	Images, files, CSV uploads	Backend API
Push Service (FCM)	Sends notifications to mobile users	Backend API triggers

Data Flow

Admin creates content → Saved to database via API → **Mobile app fetches latest data →** Users see updated content

User takes assessment → Results stored in database → **Admin sees analytics →** Reports and charts updated in real-time

Admin deactivates user → Auth token invalidated → **App shows login screen →** Access revoked instantly

3. Android App — Features & Screens

The Android app is the user-facing product. It is designed with a dark-first, premium aesthetic inspired by CRED and Flow. The app supports 10,000+ simultaneous users and is built with performance-first architecture.

3.1 Registration & Login

- Email/phone registration with OTP verification
- Secure login with password and optional biometric (fingerprint/face)
- Google social login integration for one-tap access
- Profile setup with basic details after first login
- Forgot password flow with email reset link

3.2 Home Dashboard

- Personalized greeting with time-based context (Good morning, Sarah)
- Mood check-in with emoji-based quick selector
- Quick action cards — Assessment, Counsellors, Workshops, Theory
- Upcoming events section with date, time, and live indicator
- Bottom navigation: Home, Explore, Sessions, Profile

3.3 Self-Assessment (Questionnaire)

- Browse available assessment categories (Anxiety, Depression, Stress, Self-esteem, etc.)
- Attempt questionnaire level-by-level with progress bar and category indicator
- Single-select radio options with animated selection state
- Resume capability — users can pause and return to where they left off
- Results page with category scores and assessment history

3.4 Counsellor Directory

- Search and filter counsellors by name, specialization, or category
- Card-based listing with avatar, name, specialization, experience, and rating
- Detailed profile view with qualifications, about section, and expertise tags
- Category-based filtering chips (All, Anxiety, Depression, CBT, etc.)

3.5 Workshops & Events

- Browse upcoming workshops and events with card-based layout
- Each event shows title, date, time, type (Workshop/Seminar), and attendee count
- Color-coded category tags for visual identification

3.6 Theory Sessions

- Module-based learning content organized by topic
- Each session shows module count, estimated duration, and progress percentage
- Progress tracking with visual bar (Start / In Progress / Done)

3.7 Analytics (User View)

- Personal wellness trend chart (weekly bar visualization)
- Category-wise score breakdown with progress bars (Anxiety, Stress, etc.)
- Assessment count, average score, and improvement tracking KPIs

3.8 Profile & Settings

- User profile with avatar, name, membership date, and streak tracking
- Stats overview: total assessments, sessions attended, streak days
- Assessment history, notifications, privacy settings, and sign-out

4. Admin Web App — Features & Modules

The admin web panel is the brain of the platform. It controls all content and data that flows to the mobile app. Built as a responsive web application with a premium dashboard interface.

> *Everything created or modified in the admin panel is immediately reflected in the Android app. The admin panel controls the entire user experience.*

4.1 Login & Authentication

Secure admin login with JWT token-based authentication. Role-based access control (Admin / Super Admin). Session management with automatic timeout and password recovery.

4.2 User Management

Complete user lifecycle management with search, filter, and pagination. Admins can view user profiles, edit details, activate/deactivate accounts, and view individual assessment history and activity logs.

4.3 Bulk User Registration

Upload CSV or Excel files to register hundreds or thousands of users at once. The system validates each row, detects duplicates, reports errors, and provides a downloadable template. Upload history with status tracking (Completed, Partial, Failed).

4.4 Counsellor Management

Add, edit, and manage counsellor profiles including name, specialization, qualifications, years of experience, and expertise tags. Admins can set counsellor status (Active/Inactive) and assign categories. Profile cards display in the mobile app exactly as configured here.

4.5 Workshops & Events Management

Create, edit, delete, and schedule workshops and events. Set title, type (Workshop/Seminar/Webinar), date, time, description, and maximum capacity. Track registration counts and attendance. Events appear in the mobile app immediately after publishing.

4.6 Theory Session Management

Create and manage theory sessions with modular content structure. Each session has a title, description, module count, and estimated duration. Admins can publish or save as draft. Published sessions become available to all app users.

5. Questionnaire Module — Deep Dive

The questionnaire system is the core assessment engine of the platform. It follows a hierarchical structure that gives admins complete control over how assessments are organized and delivered to users.

5.1 Category CRUD

Categories are the top-level organizer (e.g., Anxiety, Depression, Stress, Self-esteem). Admins can create, read, update, and delete categories. Each category can contain multiple levels.

5.2 Level CRUD

Levels exist within each category and represent difficulty or progression tiers (e.g., Level 1 — Basic, Level 2 — Intermediate, Level 3 — Advanced). Each level can contain multiple questions.

5.3 Question CRUD

Questions are created and organized by both level and category. Each question has a text body, multiple-choice options, correct answer, and question type (MCQ, Scale, Yes/No).

5.4 Questionnaire Builder

The builder lets admins compose assessments by selecting a category and level, then adding or removing questions from the available pool. Admins can preview before publishing.

Assessment Flow (End to End)

Step	Who	What Happens
1. Create Category	Admin	Creates 'Anxiety' category in admin panel
2. Create Levels	Admin	Adds Level 1, Level 2, Level 3 under Anxiety
3. Add Questions	Admin	Creates 24 questions, assigns to Anxiety > Level 1
4. Build Questionnaire	Admin	Selects 8 questions from Level 1 to form an assessment

5. Publish	Admin	Questionnaire goes live and appears in the app
6. Attempt	App User	User takes the assessment on their phone
7. Results	App User	User sees their score and category breakdown
8. Analytics	Admin	Admin sees completion rates, scores, and trends

6. Analytics Dashboard

The analytics dashboard provides real-time data visualization for admins to monitor platform health and user engagement. All data is generated from actual user activity on the mobile app.

Key Metrics

Metric	Description	Visualization
User Registration Trend	New users over time (daily/weekly/monthly)	Bar chart
Questionnaire Completion Rate	% of users who finish started assessments	Progress bars by category
Category-wise Attempts	Which categories are most/least popular	Donut chart
Counsellor Load	How many sessions each counsellor handles	Horizontal bar chart
Workshop Attendance	Registration vs actual attendance rate	Comparison chart
Active Daily Users	Users who opened the app today	KPI card with trend
Average Completion Time	How long assessments take on average	KPI card

All analytics data can be exported as CSV or PDF reports. Date range filters allow admins to view data for custom periods.

7. Technology Stack

Layer	Technology	Why
Mobile App	React Native or Flutter	Cross-platform ready, performant, large ecosystem
Mobile UI	Material Design 3	Modern, accessible, native-feeling components
Web Frontend	React.js / Next.js	Fast, component-based, great for dashboards
Web Styling	Tailwind CSS	Utility-first, rapid development, consistent design
Charts	Chart.js / Recharts	Interactive, responsive, export-ready
Backend API	Node.js (Express) or Django REST	Proven, scalable, large community
Database	PostgreSQL (managed)	Reliable, ACID-compliant, structured data
Cache	Redis	Session management, fast lookups, rate limiting
Cloud	AWS or Google Cloud Platform	Auto-scaling, managed services, global availability
Push Notifications	Firebase Cloud Messaging	Free, reliable, Android-native
Auth	JWT + bcrypt + OAuth 2.0	Secure, stateless, supports social login
Containers	Docker + Kubernetes	Consistent deployments, horizontal scaling

8. Scalability & Infrastructure

Requirement	Solution
10,000+ simultaneous users	Horizontal auto-scaling with load balancer across multiple server instances
99.9% uptime target	Multi-AZ deployment with automatic failover and health monitoring
<200ms API response time	Redis caching, database read replicas, CDN for static assets
Data security	TLS 1.3 in transit, AES-256 at rest, RBAC with audit logging
Database scalability	Managed PostgreSQL with connection pooling, read replicas
Growth headroom	Auto-scaling policies — scales up during peak, down during off-hours
Disaster recovery	Automated daily backups, point-in-time recovery, cross-region replication
Monitoring	CloudWatch / Datadog for metrics, error tracking, and alerting

9. Development Timeline

Estimated total delivery: 3 months (12 weeks) using agile methodology with 2-week sprints. Bi-weekly demos with client for feedback and course correction.

Phase	Timeline	Deliverables
Discovery & Design	Week 1-2	Requirements finalization, wireframes, high-fidelity UI/UX mockups (Figma), architecture design, database schema
Backend + Web Admin	Week 3-6	API development, database setup, authentication, admin panel (user mgmt, counsellor mgmt, questionnaire builder, bulk registration)
Android App	Week 5-9	Mobile app development (parallel track), questionnaire engine, counsellor directory, workshops, theory sessions, analytics
Integration + Analytics	Week 9-11	Analytics dashboard, charts/exports, push notifications, API optimization, end-to-end integration testing
QA & Launch	Week 11-12	Load testing (10K users), security audit, device testing, Play Store submission, cloud deployment, handover

10. UI Previews (Attached Files)

Interactive UI previews have been created for both the Android app and the Admin web dashboard. These are standalone HTML files that work in any browser — no installation or setup required.

> *These files are attached alongside this document. Simply open the HTML file in Chrome, Safari, Edge, or any modern browser. Click the navigation tabs to browse all screens interactively.*

Android App UI

11 interactive screens: Splash, Onboarding, Login, Home, Assessment, Counsellors, Profile Detail, Workshops, Theory, Analytics, My Profile.

Attached File	Description
MindCare_UI_Dark_Mode.html	Premium dark theme (CRED/Flow-inspired) — mint accent on deep black
MindCare_UI_Light_Mode.html	Clean light theme — teal accent on white, same 11 screens

Admin Web Dashboard UI

8 interactive sections: Dashboard, User Management, Counsellor Management, Questionnaire Builder, Workshops & Events, Theory Sessions, Bulk Registration, Analytics.

Attached File	Description
MindCare_Admin_Dashboard.html	Dark theme admin panel with sidebar navigation
MindCare_Admin_Dashboard_Light.html	Light theme admin panel with same functionality
